

Case Study- CyberBullying

Cyberbullying is a type of online harassment where individuals are targeted through digital platforms such as social media, messaging apps, or online forums. It often involves abusive messages, spreading rumors, or sharing embarrassing content to harm someone emotionally.

A common scenario involves a college student who posts content on social media. A group of classmates begins making negative comments, trolling, and sharing edited images to mock the student. Gradually, the situation escalates as more people join in, and the victim starts receiving personal messages filled with insults and threats.

This type of crime usually targets teenagers and college students, as they are highly active on social media platforms. Victims often feel isolated, anxious, and stressed due to continuous online harassment. In some cases, it can affect their academic performance and mental health.

The consequences of cyberbullying can be serious. It can lead to loss of confidence, depression, and even long-term psychological impact. In extreme cases, it may also result in self-harm tendencies.

This case highlights the importance of responsible online behavior and the need for strict action against cyberbullying to ensure a safe digital environment.
